

Identify Risk + Reward

Milliman PRM Analytics® offers actionable data to optimize healthcare management.

With PRM Analytics, healthcare providers can identify patients with high actuarial risk and the clinical opportunity that may result from managing such patients. The PRM platform is based on a core digital data repository and set of application modules that can be assembled to support patient relationship management. Through the use of predictive analytics and a patient stratification process, Milliman PRM Analytics utilizes an innovative predictive analytic process that focuses on actuarial risk and clinical opportunity—the risk of above-average healthcare expense outcomes and how care management may reduce that risk. It is one of the first predictive tools to connect the clinical characteristics of the patient with the estimated financial impact that may be derived from the management of that patient, providing critical business information required for care management decision making.

The tool can stand alone or integrate with data warehouses, clinical data repositories, care management systems, health information exchanges, or other platforms.

For more information about how you can use PRM Analytics in your organization or to schedule a demonstration, contact:
